Endpoints

Send Disbursement:

This endpoint will request to send the disbursement transfer amount to the indicated account details.

Method: POST

Result: A new disbursement details entry on the disbursement table with status PENDING.

Endpoint: [gateway-host]/api/disbursements/send

Request Body:

- Merchant Reference No: Unique Reference number passed in by the client of the API. All disbursements with an already existing clientReferenceNo are rejected
- Channel: Channel where the disbursement will be facilitated (must be INSTAPAY)
- Institution Code: Code assigned to the originating financial institution (see list of banks)
- creditInformation
 - Amount: Amount to be credited to the recipient's account. Total amount including any optional tips and external fees (applicable for some transfers, like P2M - person to merchant)
 - Remarks: Any special remarks
- Recipient Information
 - Account Number: Account number that initiated the fund disbursement
 - First Name: Recipient first name
 - Middle Name Recipient middle name
 - Last Name: Recipient last name
 - mobileNumber: Recipient mobile number
 - Email: Recipient email
 - Address:
 - Line1:
 - Line2:
 - City
 - Postal Code
 - Province
 - Country Code

Sample Request Body:

```
{  
  "merchantReferenceNo" : "P0123",  
  "channel" : "INSTAPAY",  
}
```

```

    "institutionCode" : "RCBC",
    "creditInformation":
    {
        "amount" : "100.00",
        "remarks" : " Payment for order"
    },
    "recipientInformation":
    {
        "accountNumber" : "12345678",
        "firstName" : "John",
        "middleName" : "Doe",
        "lastName" : "Smith",
        "mobileNumber" : "09123456789",
        "email" : "joh@doe.com",
        "address" :
        {
            "Line1": "Address",
            "Line2" : null,
            "city" : "Mandaluyong",
            "postalCode" : "3908",
            "province" : "Metro Manila",
            "countryCode" : "PH"
        }
    }
}

```

Headers:

```

{
    "Authorization" : "Basic base64(accessKey:secretKey)"
}

```

Response:

The response will be an HTTP 200 with an empty body which means that the disbursement has been scheduled. Once executed, a webhook will be sent.

Note: The authorization header follows HTTP Basic Authentication:

[Basic authentication](#) is an authentication scheme built into the HTTP protocol. The client sends HTTP requests with the **Authorization** header that contains the word **Basic** word followed by a space and a base64-encoded string **accessKey:secretKey**. For example, to authorize as **demo** / **p@55w0rd** the client would send

Authorization: Basic ZGVtbzpwQDU1dzByZA==

Read Disbursement By Id

This endpoint will query the disbursement based on the path parameter id value passed and return the requested disbursement object.

Method: GET

Result: The disbursement object details including the status.

Endpoint: {gateway-host}/api/disbursements/{id}

Headers:

```
{
  "Authorization" : "Basic base64(accessKey:secretKey)"
}
```

Sample Response:

```
{
  "id" : 1,
  "merchantId" : 2040,
  "merchantName" : "Lenovo",
  "registrationTime" : "",
  "SettlementTime": "",
  "merchantReferenceNo" : "P0123",
  "channel" : "INSTAPAY",
  "institutionCode" : "RCBC",
  "creditInformation":
  {
    "amount" : "100.00",
    "remarks" : " Payment for order"
  },
  "recipientInformation":
  {
    "accountNumber" : "12345678",
    "firstName" : "John",
    "middleName" : "Doe",
    "lastName" : "Smith",
    "mobileNumber" : "09256789098",
    "email" : "joh@doe.com",
    "address" :
    {
      "Line1": "Address",
      "Line2" : null,
      "city" : "Mandaluyong",
      "postalCode" : "3908",
      "province" : "Metro Manila",
    }
  }
}
```

```
        "countryCode" : "PH"
    },
    "channelReferenceNo" : "WPOU324342",
    "bankOperationId" : "0918".
    "Status" : "EXECUTED",
    "errorMessage" : "Bank unavailable"
}
```

Read Disbursements

This endpoint will request for all the available disbursements for the given merchant based on the criteria passed.

Method: GET

Result: List of disbursement objects

Endpoint: {gateway-host}/api/disbursements

Request Body:

- merchantId: Merchant id for whom the payment was registered.
- merchantReferenceNo: The reference no which was provided in the initial send request.
- channelReferenceNo: The reference no which was assigned by the channel (e.g INSTAPAY)
- dateFrom: Date when the transaction was created (lower bound inclusive)
- dateTo: Date when the transaction was created (upper bound, inclusive)
- Status: Set of status the disbursement must match (e.g. PENDING, EXECUTED, REJECTED)

Headers:

```
{
    "Authorization" : "Basic {encodedAccessKey: encodedSecretKey}"
}
```

Webhook

Once the disbursement has been processed, the following callback will be sent to your domain, indicating the status of the disbursement:

```
https://{webhook_url}?x_access_key=XXX&x_reference_no=YYY&x_disbursement_status=EXECUTED&signature=f5351846052f953dab24221d622138f4979de3cffa1058db77daa7314e4340a9
```

Calculating the signature

To confirm the authenticity of the callback, we sign all requests. A combination of an access key and HMAC-SHA256 (<https://en.wikipedia.org/wiki/HMAC>) makes sure the request was not tempered with.

The signature is computed using:

- * key - Secret key granted by SwiftPay, 32 characters
- * message - a string of all key-value pairs that start with x_ (where the key is a name the request parameter and value is its value), sorted alphabetically, and concatenated without separators. Message sample that needs to be encrypted using HMAC-SHA256:

```
x_access_keyXXXx_reference_noYYYx_disbursement_statusEXECUTED
```
